ABSTRACT

*Dial activity of two sympatric lizards **Mabuya multifasciata** and **Tachydromus sexlineatus** in cacao plantation under four weather conditions (sunny, little bit cloudy, cloudy and sunny with wet surface ground) were observed. **M. multifasciata** were active as long as the light condition permitted; they were active also even on cloudy and fine wet surface ground when **T. sexlineatus** were not active. The number of active individual of **T. sexlineatus** was influenced by the number of active individual of **M. multifasciata**. This mechanism was seem to avoid competition between two species.*

Key words: *Dial activity, sympatric, lizard.*
